

GALLOWAY ACOUSTICS

BBC Media City

Case Study GA 27

When the BBC relocated some of their facilities to Manchester Galloway Acoustics were chosen to supply and install an array of both Acoustic and complimentary Non-Acoustic Louvres on the Energy/Car Park building.

The design incorporated several large louvre banks with some as high as 14m.

The interface between Acoustic and Non Acoustic louvre had to be seamless and hence at identical blade pitches.

Stringent noise specifications were required and the Acoustic Louvres assisted in the overall target noise levels being met.

Within the construction of each bank feature such as access doors, lifting beam penetrations and structural support steelwork designed by Galloway and incorporated into the overall installation.

Galloway Acoustics had an experienced team of Acoustic and Design engineers who can assist you with all your Noise control issues.
